Description	PHP remote file inclusion vulnerability in includes/pear/Net/DNS/RR.php in ProgSys 0.151 and earlier allows remote attackers to execute arbitrary code or cause a denial of service (memory consumption) via crafted HTTP requests. The vulnerability exists because the application does not properly sanitize the 'RR' parameter of the 'RR.php' script, which is used to retrieve DNS records. This allows an attacker to inject malicious code that can be executed on the server.
