CVE-2007-4169

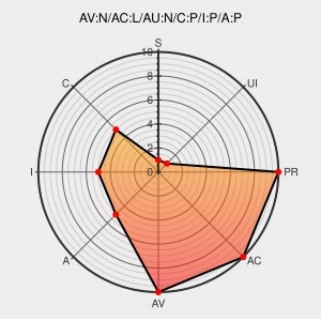
Source: Mitre | Source: NIST | CVE.ORG | Print: PDF



Certain versions of Vgallite from Vgallite contain the following vulnerability:

** DISPUTED ** Multiple PHP remote file inclusion vulnerabilities in vgallite allow remote attackers to execute arbitrary PHP code via a URL in the (1) dirpath parameter to _functions.php or the (2) lang parameter to index.php. NOTE: CVE disputes vector 1 because the applicable include_once is located in a function that is not called on a direct request, and because $dirpath is an argument to this function. CVE disputes vector 2 because "lang" is a constant string within an include_once, not a variable. The researcher is also unreliable.

CVE-2007-4169 has been assigned by cve@mitre.org to track the vulnerability

CVSS2 Score: 7.5 - HIGH
