

CVE-2007-5416

Published on: 10/12/2007 12:00:00 AM UTC

Last Modified on: 03/23/2021 11:25:37 PM UTC

CVE-2007-5416

[Source: Mitre](#)[Source: NIST](#)[CVE.ORG](#)[Print: PDF](#) 

Certain versions of [Drupal](#) from [Drupal](#) contain the following vulnerability:

Drupal 5.2 and earlier does not properly unset variables when the input data includes a numeric parameter with a value matching an alphanumeric parameter's hash value, which allows remote attackers to execute arbitrary PHP code by invoking the drupal_eval function through a callback parameter to the default URI, as demonstrated by

the `_menu[callbacks][1][callback]` parameter. NOTE: it could be argued that this vulnerability is due to a bug in the unset PHP command (CVE-2006-3017) and the proper fix should be in PHP; if so, then this should not be treated as a vulnerability in Drupal.

CVE-2007-5416 has been assigned by [M](#) cve@mitre.org to track the vulnerability
