

# CVE-2008-1015

[MITRE](#)[NVD](#)[CVE.ORG](#)[JSON API](#)[Print: PDF](#)

## Summary

|                        |                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>CVE</b>             | CVE-2008-1015                                                                                                                         |
| <b>State</b>           | PUBLIC                                                                                                                                |
| <b>Assigner</b>        | cve@mitre.org                                                                                                                         |
| <b>Source Priority</b> | CVE Program / NVD first with legacy fallback                                                                                          |
| <b>Published</b>       | 2008-04-04 17:44:00 UTC                                                                                                               |
| <b>Updated</b>         | 2017-08-08 01:29:00 UTC                                                                                                               |
| <b>Description</b>     | Buffer overflow in the data reference atom handling in Apple QuickTime before 7.4.5 allows remote attackers to execute arbitrary code |

## Risk And Classification

### Problem Types: CWE-119

## NVD Known Affected Configurations (CPE 2.3)

| Type        | Vendor                | Product                   | Version | Update | Edition | Language |
|-------------|-----------------------|---------------------------|---------|--------|---------|----------|
| Application | <a href="#">Apple</a> | <a href="#">Quicktime</a> | All     | All    | All     | All      |
