Description	Multiple PHP remote file inclusion vulnerabilities in osDate 2.1.9 and 2.5.4, when magic_quotes_gpc is disabled and register_globals is enabled. The vulnerabilities exist in the file_inclusion() function, which does not properly sanitize the \$file parameter before using it in the fopen() function. This allows an attacker to include arbitrary files on the remote host, leading to a remote code execution (RCE) vulnerability. The affected versions are 2.1.9 and 2.5.4. The vulnerability is fixed in version 2.1.10 and 2.5.5.
