

# CVE-2012-5905

[MITRE](#)[NVD](#)[CVE.ORG](#)[JSON API](#)[Print: PDF](#)

## Summary

|                        |                                                                                                                               |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>CVE</b>             | CVE-2012-5905                                                                                                                 |
| <b>State</b>           | PUBLIC                                                                                                                        |
| <b>Assigner</b>        | cve@mitre.org                                                                                                                 |
| <b>Source Priority</b> | CVE Program / NVD first with legacy fallback                                                                                  |
| <b>Published</b>       | 2012-11-17 21:55:00 UTC                                                                                                       |
| <b>Updated</b>         | 2017-08-29 01:32:00 UTC                                                                                                       |
| <b>Description</b>     | Buffer overflow in KnFTPD 1.0.0 allows remote authenticated users to cause a denial of service (crash) via a long string in a |

## Risk And Classification

### Problem Types: CWE-119

## NVD Known Affected Configurations (CPE 2.3)

| Type        | Vendor                    | Product                | Version | Update | Edition | Language |
|-------------|---------------------------|------------------------|---------|--------|---------|----------|
| Application | <a href="#">Elif Keir</a> | <a href="#">Knftpd</a> | 1.0.0   | All    | All     | All      |
| Application | <a href="#">Elif Keir</a> | <a href="#">Knftpd</a> | 1.0.0   | All    | All     | All      |
