

CVE-2014-6277

Published on: 09/27/2014 12:00:00 AM UTC

Last Modified on: 03/23/2021 11:25:54 PM UTC

CVE-2014-6277

[Source: Mitre](#)[Source: NIST](#)[CVE.ORG](#)[Print: PDF](#) 

Certain versions of [Bash](#) from [Gnu](#) contain the following vulnerability:

GNU Bash through 4.3 bash43-026 does not properly parse function definitions in the values of environment variables, which allows remote attackers to execute arbitrary code or cause a denial of service (uninitialized memory access, and untrusted-pointer read and write operations) via a crafted environment, as demonstrated by vectors involving the ForceCommand feature in OpenSSH sshd, the mod_cgi and mod_cgid modules in the Apache HTTP Server, scripts executed by unspecified DHCP clients, and other situations in which setting the environment occurs across a privilege boundary from Bash execution. NOTE: this vulnerability exists because of an incomplete fix for CVE-2014-6271 and CVE-2014-7169.

CVE-2014-6277 has been assigned by security@debian.org to track the vulnerability

CVSS2 Score: **10 - HIGH**
