

# CVE-2016-8023

[MITRE](#)[NVD](#)[CVE.ORG](#)[JSON API](#)[Print: PDF](#)

## Summary

|                        |                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>CVE</b>             | CVE-2016-8023                                                                                                              |
| <b>State</b>           | PUBLIC                                                                                                                     |
| <b>Assigner</b>        | secure@intel.com                                                                                                           |
| <b>Source Priority</b> | CVE Program / NVD first with legacy fallback                                                                               |
| <b>Published</b>       | 2017-03-14 22:59:00 UTC                                                                                                    |
| <b>Updated</b>         | 2017-09-03 01:29:00 UTC                                                                                                    |
| <b>Description</b>     | Authentication bypass by assumed-immutable data vulnerability in Intel Security VirusScan Enterprise Linux (VSEL) 2.0.3 (; |

## Risk And Classification

**Problem Types:** CWE-287

## NVD Known Affected Configurations (CPE 2.3)

| Type        | Vendor                 | Product                              | Version | Update | Edition | Language |
|-------------|------------------------|--------------------------------------|---------|--------|---------|----------|
| Application | <a href="#">Mcafee</a> | <a href="#">Virusscan Enterprise</a> | All     | All    | All     | All      |
