| <b>Description</b>     | A vulnerability in the web application in the Cisco Prime Collaboration Provisioning tool could allow an unauthenticated, remote user to perform a Denial of Service (DoS) attack on the tool. The vulnerability is due to a buffer overflow in the tool's session hijacking functionality. An attacker could exploit this vulnerability by sending a specially crafted request to the tool. The tool would then crash, resulting in a DoS attack. This vulnerability affects versions of the tool prior to 11.2_base. Cisco has released a patch for this vulnerability in version 11.2_base. |

## Risk And Classification

### Problem Types: CWE-287
