Certain versions of [Drupal](#) from [Drupal](#) contain the following vulnerability:

In Drupal versions 8.4.x versions before 8.4.5 when using node access controls with a multilingual site, Drupal marks the untranslated version of a node as the default fallback for access queries. This fallback is used for languages that do not yet have a translated version of the created node. This can result in an access bypass vulnerability. This

issue is mitigated by the fact that it only applies to sites that a) use the Content Translation module; and b) use a node access module such as Domain Access which implement `hook_node_access_records()`.

CVE-2017-6930 has been assigned by [security@drupal.org](#) to track the vulnerability - currently rated as **HIGH** severity.
