CVE-2019-19039

[Source: Mitre](#)[Source: NIST](#)[CVE.ORG](#)[Print: PDF](#) 

Certain versions of [Ubuntu Linux](#) from [Canonical](#) contain the following vulnerability:

**** DISPUTED **** `__btrfs_free_extent` in `fs/btrfs/extent-tree.c` in the Linux kernel through 5.3.12 calls `btrfs_print_leaf` in a certain `ENOENT` case, which allows local users to obtain potentially sensitive information about register values via the `dmesg` program. NOTE: The BTRFS development team disputes this issues as not being a vulnerability

because “1) The kernel provide facilities to restrict access to `dmesg` - `dmesg_restrict=1` sysctl option. So it's really up to the system administrator to judge whether `dmesg` access shall be disallowed or not. 2) `WARN/WARN_ON` are widely used macros in the linux kernel. If this CVE is considered valid this would mean there are literally thousands CVE lurking in the kernel - something which clearly is not the case.”

CVE-2019-19039 has been assigned by [M](#) `cve@mitre.org` to track the vulnerability - currently rated as **MEDIUM** severity.

CVSS3 Score: **5.5 - MEDIUM**

Attack Vector	Attack Complexity	Privileges Required	User Interaction
LOCAL	LOW	NONE	REQUIRED
Scope	Confidentiality Impact	Integrity Impact	Availability Impact
UNCHANGED	HIGH	NONE	NONE

CVSS2 Score: **1.9 - LOW**

Access Vector	Access Complexity	Authentication
LOCAL	MEDIUM	NONE
Confidentiality Impact	Integrity Impact	Availability Impact
PARTIAL	NONE	NONE
