CVSS:30/AV:N/AC:H/PR:N/UI:N/S:U/C:H/I:H/A:H

Certain versions of [Osquery](#) from [Linuxfoundation](#) contain the following vulnerability:

In some configurations an attacker can inject a new executable path into the extensions.load file for osquery and hard link a parent folder of a malicious binary to a folder with known 'safe' permissions. Under those circumstances osquery will load said malicious executable with SYSTEM permissions. The solution is to migrate installations to the

'Program Files' directory on Windows which restricts unprivileged write access. This issue affects osquery prior to v3.4.0.

CVE-2019-3567 has been assigned by [Facebook](#) cve-assign@fb.com to track the vulnerability - currently rated as **HIGH** severity.
