Certain versions of [Tensorflow](#) from [Google](#) contain the following vulnerability:

TensorFlow is an open source platform for machine learning. If `QuantizedBiasAdd` is given `min\_input`, `max\_input`, `min\_bias`, `max\_bias` tensors of a nonzero rank, it results in a segfault that can be used to trigger a denial of service attack. We have patched the issue in GitHub commit

785d67a78a1d533759fcd2f5e8d6ef778de849e0. The fix will be included in TensorFlow 2.10.0. We will also cherry-pick this commit on TensorFlow 2.9.1, TensorFlow 2.8.1, and TensorFlow 2.7.2, as these are also affected and still in supported range. There are no known workarounds for this issue.

CVE-2022-35972 has been assigned by [security-advisories@github.com](#) to track the vulnerability - currently rated as **HIGH** severity.

Affected Vendor/Software: [tensorflow](#) - tensorflow version < 2.7.2

Affected Vendor/Software: [tensorflow](#) - tensorflow version >= 2.8.0, < 2.8.1

Affected Vendor/Software: [tensorflow](#) - tensorflow version >= 2.9.0, < 2.9.1

CVSS3 Score: **7.5 - HIGH**
