Description	A Command Injection vulnerability in the web management interface in Aver PTC320UV2 0.1.0000.65 allows an unauthenticated user to execute arbitrary commands on the host. The vulnerability is caused by the application not properly sanitizing user input before it is used in a system command. An attacker can exploit this by sending a specially crafted request that includes a command to be executed on the server. For example, an attacker could send a request that includes the command 'cat /etc/passwd', which would result in the server displaying the contents of the /etc/passwd file. This vulnerability has a CVSS score of 6.5 (Medium) and an EPSS of 0.067460000.
